Diva is a virtual analogue synthesizer in a true wooden enclosure. The interface is built like a grand piano, with a Moog style keyboard and a built-in LFO. It comes with 128 wavetables and the ability to use the analog synthesizer as a DSP audio effect with its very own delay line. Diva was developed by Sir Jon Ronson-Taylor, as a tribute to the great analog synths like the Roland SH-101 and the E-mu Emax. Key Features: 128 wavetables Beat detection and sync Wave sequencer with counter Polyphonic aftertouch and a big arpeggiator FM envelope follower and sub-oscillators Diva was developed by Sir Jon Ronson-Taylor, as a tribute to the great analog synths like the Roland SH-101 and the E-mu Emax. We'll see if it's as magical as the people claim. What I'm doing: I'm selling/trading acoustic guitars in Portland, Oregon. I'm very excited about playing them. I also make and sell my own guitar strings and other guitar accessories. What's it all about: I've been a guitar player since I was about 12. I made my first stringed instrument when I was in the 3rd grade. Now I have 6 guitars, 5 acoustic guitars, 4 electric guitars, one piano, and a Wurlitzer. I do lots of music, art, math, software, and business. I'm really enjoying it all. My Story: I started making my own strings about 7 years ago. I made some really crappy strings.

- a new retro-style interface that looks like a classic synth instrument. - MIDI recording function - fully compatible with macOS High Sierra. - 16-voice polyphony, 16-bit (floating point) - features - 33 different parameters, can be assigned per oscillator/filter, can be shared with three connected controllers - 64MB of internal RAM - 100 presets - Mac OS X 10.7 Lion and Mac OS X 10.9 are supported KEYMACRO Description: We all know what a microphone is, and we also know how to use it to record sound. But what if it has a strange effect on our music? And what if it's not just an instrument that can add to the beauty of our songs? Well, what if it's something else? The problem is that microphones are designed to capture sound, and although it's possible to find microcassette, they are very heavy, and most of the time I don't even use them, preferring to use a better microphone instead. You can record anything without a microphone, and here is a very small list of ways you can do it. So let's get

started! Heres a really useful app that I use to record myself when I'm at the studio, to make sure I don't have to keep relying on a mic. Although it sounds ridiculous, it works pretty well. When i'm recording myself, I usually use the cable that comes with the Creative Cloud. No, this is not because of software glitches, but simply because the other one is very bad. But if you want to check it out, this is the cable that I use: Heres another really useful app I use to check the acoustic quality of my studio. It's a very powerful tool, and it's really the way I check my setup. I use its auto-replay feature to make sure my room is as close to the perfect room as possible, or else I will have to check the room by myself. I use the app in the following way: I cannot think of another app that would be more useful than this one! With it, you can set up a song and check the level of harmonics, airiness, peakiness, and all that other good stuff. It will really help you to know what the room is like. With a modular architecture, the VS-20 has many presets which you can use in your music production. Description: The SubFilter is inspired by the Roland VS-20, the classic guitar synth. You will find a subharmonic oscillator, a lowpass filter, a modulator, and a resonant filter. Description: The VCO is a classic oscillator with a sawtooth input and a triangular input, which provides a very intuitive interface for pitch control. It has three attack and decay settings, three harmonic options, and a sample & hold function. The distortion can be configured as lowpass, bandpass, highpass, and notch, and the signal can be routed to the input or output. VSTSynth: The SPFilter is a three-stage highpass filter. Its various parameters can be changed in real time. Description: A highpass filter is basically a lowpass filter with a very high cut-off frequency. The cut-off frequency of a filter depends on the parameters set. There are a number of really good highpass filters in the library which can be used as a starting point for the development of your own highpass filter.
